TRACK 1

PREDICTIVE MODEL TRACK

ECODRIVE AI

problem STATEMENT

Taylor’s University experiences traffic congestion during lunch hours and peak periods, causing delays and inconvenience for students and staff. Stop-and-go traffic may also increase fuel consumption and commuting costs. EcoDrive AI aims to help drivers understand fuel inefficiency, investigate possible causes, and identify smarter, more cost-effective commuting choices.

our goal

Monitor fuel consumption

Track & compare fuel consumption to identify unusual changes in vehicle efficiency

Identify potential causes

Use AI to investigate possible factors contributing to increased fuel consumption

Estimate financial impact

Calculate additional fuel expenses & help drivers understand the financial consequences of inefficient driving

Provide personalised recommendations

Suggest practical actions to improve fuel efficiency & reduce unnecessary fuel expenditure

TARGET AUDIENCE

University students

Students who drive to campus & want to manage their fuel expenses

Daily commuters

Individuals who regularly drive to work or other destinations

E-hailing drivers

Grab drivers and other ride-hailing drivers who want to maximise their earnings

WHY ECODRIVE?

- Reduced fuel costs
- AI-powered insights
- Smart recommendations
- Sustainable driving

THANK YOU
